The p51 gene can be used in the investigation, diagnosis and treatment of diseases such as cancer, with which the p53 family cell proliferation regulation is associated. The p51 protein may be used for screening potential agonists and antagonists of its regulatory function,

                                                                                                                                                                                                          CC ell regulatory proteins (CRPs) termed the p63 family of coll regulatory proteins (CRPs) termed the p63 family of proteins, CC which demonstrate certain sequence identity to known tumour CC suppressor proteins p53 and p73. It has been observed that the CC intron-exon organisation is conserved between p73 and p53, and from CC known exon and intron sizes for these 2 genes, it was possible to CC identify now members of this gene family using a PCR-based strategy CC intron. The human p53 gene was localised to chromosomal position CC 3q27-29. At least 6 different isotypes exist. Splice variants CC differing at the C-terminus have been designated as alpha, beta and CR gamma forms, while p63 members differing in the N-terminus are CC designated as deltan and TA forms, where the deltan form lacks the CT transactivation domain. The present sequence represents human CC p63 isotype TAp63.alpha. p63 was detected in a variety of human and mouse tissue. It demonstrates remarkably divergent activities, such as the ability to transactivate of p63 expression CC differentiation, both benign and neoplastic. Deltan isotopes of p63 act as dominant negatives towards transactivation by p53 and p63. CC cachexia) and neuronal differentiation and related degenerative cc disorders. p63 polypeptides (see AAV05953-64), polynucleotides (see AAX58572-83) and anti-p63 antibodies of the invention can be used to cidentify compounds useful for treating disorders involving such

The chimeric gene can be used for gene therapy of p53 variant human tumours, and analysis of the function of the p53 family gene. The present sequence was used in the

                                                                                                                                                                                                                                                                                oncogenic fusion protein, treating cancerous cells containing fusion protein in heterogeneous cell population, treating proliferative disease (e.g. rheumatoid arthritis or cancer) associated with mutant protein or cellular protein isoform dependent on heat shock protein (HSP)-90 (e.g. p53), or selectively treating cells expressing mutant protein or cellular protein isoform in a patient heterozygous for (II). The method is useful for treating a disease e.g. haematopoietic disorder such as T or B cell lymphoma, chronic myeloid leukaemia (CML), APL, ALL, AML, NHL and CMML, or a disease characterised by a solid tumour such as papillary thyroid carcinoma, Ewing's sarcoma, melanoma, liposarcoma, rhabdomyosarcoma and synovial sarcoma. The method is also useful for treating viral
                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes a method of treating genetically-defined disease associated with chromosomal aberrations yielding oncogenic fusion proteins (I), treating cancerous cells containing (I) in a heterogeneous cell population, treating proliferative diseases associated with mutant protein or cellular protein isoforms (II) dependent on heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treating genetically-defined disease associated with chromosomal aberrations yielding oncogenic fusion proteins, e.g. cell proliferative diseases, involves administering an inhibitor of heat shock protein 90
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI;

The polypeptides and polynuclectides are used in compositions and vaccines to inhibit the development of cancer, especially lung cancer, in a patient. Methods described in the invention can be used to monitor the progression of a cancer by carrying out the detection at subsequent time points and comparing the results from the different time points. CD4+ and/or CD8+ T-Cells isolated from a patient cells expressing P2 and then administered to the patient to inhibit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 development of cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0
                                                                                                                                                                      밁
                                             δÃ
                                                                                                                                                                                      CC protein (HEP)-90, or selectively treating cells expressing (II)
CC involving administering HEP90-inhibitor. The method is useful for
CC treating genetically-defined disease with chromosomal aberration yielding
CC oncogenic fusion protein, treating cancerous cells containing fusion
CC protein in heterogeneous cell population, treating proliferative disease
CC (e.g. rheumatoid arthritis or cancer) associated with mutant protein or
CC cellular protein isoform dependent on heat shock protein (HEP)-90 (e.g.
CC protein isoform in a patient heterozygous for (II). The method is useful
CC protein isoform in a patient heterozygous for (II). The method is useful
CC for treating a disease e.g. haematopoletic disorder such as T or B cell
CC Iymphoma, chronic myeloid leukaemia (CML), APL, AML, NHL and CMML,
CC or a disease characterised by a solid tumour such as papillary thyroid
CC carcinoma, Ewing's sarcoma, melanoma, liposarcoma, rhabdomyosarcoma and
CC synovial sarcoma. The method is also useful for treating viral
CC infections. This is the amino acid sequence of a human oncogenic protein.
                                                                                         Matches
                                                                                                            Query Match

considered with chromosomal aberrations yielding oncogenic fusion coll population, treating cancerous cells containing (I) in a heterogeneous cell population, treating proliferative diseases associated with mutant careful protein or cellular protein isoforms (II) dependent on heat shock containing (I) in a heterogeneous cell population, treating proliferative diseases associated with mutant careful for contein (HSP)-90, or selectively treating cells expressing (II) contein (HSP)-90, or selectively treating cells expressing (II) containing fusion concogenic fusion protein, treating cancerous cells containing fusion concogenic fusion protein, treating cancerous associated with mutant protein or cellular protein isoform dependent on heat shock protein (HSP)-90 (e.g. ps3), or selectively treating cells expressing mutant protein or cellular protein isoform in a patient heterozygous for (II). The method is useful containing a disease e.g. haematopoietic disorder such as T or B cell lymphoma, chronic myeloid leukaemaia (CML), ALL, AML, NHL and CML, contained by a solid tumour such as papillary thyroid cortinoma, Eminy's sarcoma, melanoma, liposarcoma, rhabdomyosarcoma and containing sarcoma. The method is also useful for treating viral confections. This is the amino acid sequence of a human oncogenic protein. Treating genetically-defined disease associated with chromosomal aberrations yielding oncogenic fusion proteins, e.g. cell proliferative diseases, involves administering an inhibitor of heat shock protein 90 describes a method of treating 338-340; English genetically-defined disease

                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes isolated human lung carcinoma polynucleotides (I) and polypeptides (II). (I) and (II) have cytostatic activity, and can be used in gene therapy and in vaccines. Compositions comprising (I) or (II) can be used for stimulating an immune response in a patient and for treating lung cancer in a patient. Oligonucleotides of (I) can be used for detecting the presence of a cancer in a patient, by obtaining a biological sample from the patient, contacting the biological sample with the oligonucleotide, detecting in the sample, an amount of polynucleotide that hybridises to the oligonucleotide and comparing the amount of polynucleotide that hybridises to the oligonucleotide to a predetermined cut-off value, and determining the patient of cancer in the patient. (I) and (II) are useful in the patient of the contaction of the cancer in the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Wang T,
McNeill
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel lung carcinoma polynucleotide sequences and polypeptides encoded by the polynucleotides, useful in pharmaceutical compositions such as vaccines and as markers to indicate the presence of lung cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             12-DEC-2000; 2000US-0735705

                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                            pharmaceutical compositions, e.g. vaccines. (I) is useful as a marker to indicate the presence or absence of a cancer such as lung cancer. ABQ92145 to ABQ92486 and ABP61866 to ABP61992 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 2; Page 328-329; 381pp; English.

Human lung tumour proteins and polynucleotides have cytostatic and immunostimulant activities, and can be used in vaccine production. Compositions comprising the lung tumour proteins, polynucleotides, antibodies, tumour proteins, or antigen presenting cells that express the lung tumour proteins, or antigen presenting cells that express the lung tumour proteins are useful for treating lung cancer or stimulating an immune response. ABI48959 to ABI49300 and ABB74946 to ABB75070 represent sequences used in the exemplification of the present

                                                                                                                                                                                                                                                                       This invention describes a novel isolated polypeptide (I) which comprising an immunogenic portion of a lung tumor protein or variant (P2) which have cytostatic activity. The polypeptides and polypurolectides are used in compositions and vaccines to inhibit the development of cancer, especially lung cancer, in a patient. Methods described in the invention can be used to monitor the progression of a cancer by carrying out the detection at subsequent time points and comparing the results from the different time points. CD4+ and/or CD8+ T-Cells isolated from a patient are treated with P2, polynucleotides encoding P2 or antigen presenting cells expressing P2 and then administered to the patient to inhibit development of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Lung can

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Д
             This invention describes a novel KET-encoding nucleic acid (I) and its fragments, variants and mutants which has anticancer activity. (I) encodes a protein, (II), involved in control of the cell cycle and apoptosis, i.e. (II) is a tumor suppressor protein which belongs to the p53 family. (I), and the polypeptide (II) encoded by it, are used (a) to detect (I) in biological samples, specifically anglogenic tumor tissue, including (I) sequences that have a homozygotic deletion and (b) to detect presence or absence of human chromosome 3q27 or murine chromosome los or their fragments, by hybridization. Also, (I) is used as a tumor
                                                                                                                                                                                                             Claim
                                                                                                                                                                                                                                            New KET-encoding nucleic acid treatment of tumors -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes isolated human lung carcinoma compositions of polynucleotides (I) and polypeptides (II). (I) and (II) have cytostatic activity, and can be used in gene therapy and in vaccines. Compositions comprising (I) or (II) can be used for stimulating an immune response in a patient and for treating lung cancer in a patient. Oligonucleotides of (I) can be used for detecting the presence of a cancer in a patient, by obtaining a biological sample from the patient, contacting the obtaining a biological sample from the patient, contacting the amount of polynucleotide that hybridises to the oligonucleotide and comparing the amount of polynucleotide that hybridises to the oligonucleotide to a predetermined cut-off value, and determining the presence of a cancer in the patient. (I) and (II) are useful in pharmaceutical compositions, e.g. vaccines. (I) is useful as a marker to indicate the presence or absence of a cancer such as lung cancer.

AB092145 to AB092486 and ABP61866 to ABP6192 represent sequences used in the exemplification of the present invention.

                                                                       The present invention describes human lung tumour proteins. Human lun tumour proteins and polynucleotides have cytostatic and immunostimula activities, and can be used in vaccine production. Compositions comprising the lung tumour proteins, polynucleotides, antibodies, tumour proteins, or antigen presenting cells that express the lung tumour proteins, or antigen presenting cells that express the lung tumour proteins are useful for treating lung cancer stimulating an immune response. ABIA9300 to ABIA9300 and ABB74946 to ABB7570 represent sequences used in the exemplification of the present proteins.
                                                                                                                                                                                                                                                                                                                                                            Wang T,

                                                                                                                                                                                                                                                                                                                                                                                                뭥
                                                                                                                                                                                                                                                                                                                                                                                                                                         Ş
                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ωy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               intron. The human p53 gene was localised to chromosomal position 3q27-29. At least 6 different isotypes exist. Splice variants differing at the C-terminus have been designated as alpha, beta and campana forms, while p63 members differing in the N-terminus are designated as deltaN and Ta forms, where the deltaN form lacks the transactivation domain. The present's equence represents human companies that the noterminus are p63 isotype hu-deltaNp63 gamma. p63 was detected in a variety p63 isotype hu-deltaNp63 gamma. p63 was detected in a variety of human and mouse tissue. It demonstrates remarkably divergent activities, such as the ability to transactivate p53 reporter genes and induce apoptosis. Cessation or down-regulation of p63 expression may play a critical role in the process of cervical squamous afferentiation, both benign and neoplastic. DeltaN isotopes of p63 act as dominant negatives towards transactivation by p53 and p63. Cessatives towards transactivation by p53 and p63. Cessatives towards transactivation by p53 and p63. Cessatives towards transactivation and related degenerative characters. p63 polypeptides (see AAX58572-83) and anti-p63 antibodies of the invention can be used to identify compounds useful for treating disorders involving such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches 629;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  which demonstrate certain sequence identity to known tumour suppressor proteins p53 and p73. It has been observed that the intron-exon organisation is conserved between p73 and p53, and from known exon and intron sizes for these 2 genes, it was possible to identify new members of this gene family using a PCR-based strategy of amplifying 2 exons in a conserved domain and their intervening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       N-PSDB;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    McKeon F,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 B
                                                    This invention describes a novel KET-encoding nucleic acid (I) and its fragments, variants and mutants which has anticancer activity. (I) encodes a protein, (II), involved in control of the cell cycle and apoptosis, i.e. (II) is a tumor suppressor protein which belongs to the p53 family. (I), and the polypeptide (II) encoded by it, are used (a) to detect (II) in biological samples, specifically angiogenic tumor tissue, including (I) sequences that have a homozygotic deletion and (b) to detect presence or absence of human chromosome 3q27 or murine chromosome 16, or their fragments, by hybridization. Also, (I) is used as a tumor suppressor, particularly in tumors where an alteration in the wild-type p53 allele has not been identified. (I) and (II) may also be used for developing cancer. This sequence represents the rat KET protein described in the activation of the content of the 
    Sequence
                                                                                                                                                                                                                                                                                                                                            Disclosure; Fig 1; 28pp; German.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     02-DEC-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             W09961610-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Rat KET protein
